BACKGROUND OF THE INVENTION

Field of the Invention

This invention generally relates to a polysulfone composition useful for
10 coating an implantable device such as a drug eluting stent.

Description of the Background

Blood vessel occlusions are commonly treated by mechanically enhancing
blood flow in the affected vessels, such as by employing a stent. Stents are used not
only for mechanical intervention but also as vehicles for providing biological therapy.
15 To effect a controlled delivery of an active agent in stent medication, the stent can be
coated with a biocompatible polymeric coating. The biocompatible polymeric coating
can function either as a permeable layer or a carrier to allow a controlled delivery of
the agent.

Polymeric coatings for delivery of therapeutic agents on implantable devices,
20 e.g., drug-eluting stents, often suffer from poor mechanical properties, poor surface
properties and poor biocompatibility. A coating on a stent with such shortcomings
would be unsatisfactory for use in a patient. For example, a stent with poor
biocompatibility may illicit undesirable immuno reactions from the patient, and a stent

with poor surface properties may not be effective in controlling release rate of an agent in the coating. Therefore, there is a need for polymeric coating compositions that provide coatings with balanced mechanical properties, optimal permeability and good biocompatibility.

- 5 The polymer and methods of making the polymer disclosed herein address the above described problems and needs.

SUMMARY OF THE INVENTION

- Disclosed herein are a polymeric composition and a coating formed therefrom comprising an elastomeric polymer, a polysulfone polymer, and optionally a bioactive agent. The elastomeric polymer can be any polymer which is elastomeric and biostable. In one embodiment, the elastomeric polymer can be, for example, polyacrylate or polymethacrylate with long side chains such as poly(butyl methacrylate) or poly(lauryl methacrylate), polyisobutylene, polyhexafluoropentene, or polysiloxane. Representative long side chains include any side chains having at least two or more carbon atoms such ethyl, propyl, isopropyl, butyl, isobutyl, lauryl, hexyl, etc.
- 10 The polysulfone polymer and the elastomeric polymer can form a simple blend or a conjugate. The conjugate can be formed by a direct chemical bonding, hydrogen bonding, or ionic bonding. The conjugate can be, for example, an ionic pair or a block copolymer. In one embodiment, the conjugate has one of the following structures:
- 15
- 20

wherein R₁ is C1 to C10 alkyl, C2, C4 and C6 hydroxyalkyl, C1 to C6

- 5 fluoroalkyl, phenyl, substituted phenyl, polyethylene glycol, and polyalkylene oxide such as ethylene oxide or propylene oxide;

wherein R₂, R₄, R₅, R₇ and R₈ are independently hydrogen, C1 to C6 alkyl, C2, C4 and C6 hydroxyalkyl, C1 to C6 fluoroalkyl, phenyl, substituted phenyl, carboxyl, amido, or ester groups bearing a polyethylene glycol, and polyalkylene oxide;

- 10 wherein R₃ is hydrogen, alkyl, cycloalkyl, phenyl, carboxyl, halo, amino, hydroxyl, amido, sulfido, and polyalkylene oxide;

wherein R₉ and R₁₀ are independently H, CH₃, F, and CF₃;

wherein R₆ is a perfluoroalkyl group; and

wherein n and m are independently positive integers.

- 15 The coating composition thus formed can be coated onto an implantable device such as a drug-eluting stent (DES). The release rate of the bioactive agent on the

implantable device can be controlled by varying the ratio of the polysulfone polymer over the elastomeric polymer, e.g., varying the n/m ratio of the copolymer described above.

DETAILED DESCRIPTION

Polysulfone Compositions

Disclosed herein are a polymeric composition comprising an elastomeric polymer, a polysulfone polymer, and optionally a bioactive agent. The composition
5 can form a coating on an implantable device such as a DES. The implantable device thus formed can be used for treating a disorder in an animal such as a human being.

The polysulfone polymer and the elastomeric polymer can be present in the present application in any ratio, for example, a ratio of between about 99.5:0.5 and 0.5:99.5, between about 99:1 and 1:99, between about 95:5 and 5:95, between about
10 90:10 and 10:90, between about 80:20 and 20:80, between about 75:25 and 25:75, between about 70:30 and 30:70, between about 60:40 and 40:60, or about 50:50. The polysulfone polymer and the elastomeric polymer can be present in the form of polymer blends or conjugates.

As used herein, the term “conjugate” refers to a group of at least two materials,
15 e.g., two molecules of different polymers, associated with each other in the form of an interaction such as ionic interaction, direct chemical bonding, hydrogen bonding, or van der Waals interaction. Exemplary conjugates include, but are not limited to, ion pairs, block copolymers such as one comprising a block of a polysulfone polymer and another block of an elastomeric polymer such as poly(butyl methacrylate) or
20 poly(lauryl methacrylate).

Polysulfone Polymers

Polysulfone surfaces have long been known to be protein and cell resistant. The material has been used in several medical applications. Among them are kidney dialysis membranes and blood oxygenator membranes. Polysulfone polymers can be generated in laboratories via routine laboratory operations or commercially available. For example, there are two types of commercially available polysulfone polymers, one is one polyethersulfone, and the other was derivatized from bisphenol.

Elastomeric Polymers

The elastomeric polymers useful for forming the blend or conjugate with the polysulfone polymer described herein can be any biocompatible elastomeric polymers. Representative examples of such elastomeric polymers include, but not limited to, natural rubber, polyisobutylene, nylon, polysiloxanes, polyperfluoroalkylene such as polyhexafluoropropylene, polymers and copolymers of acrylates or methacrylates with long side chains such as poly(butyl methacrylate), poly(lauryl methacrylate), and polyalkylene oxide or polyalkylene oxide acrylates. In one embodiment, the blend or conjugate can exclude any of the aforementioned elastomeric polymers.

Conjugates

In accordance with one aspect of the invention, the conjugates disclosed herein can be ion pairs or can be conjugates having other ionic interaction, hydrogen bonding, or van der Waals interaction. Conjugates of this nature can be formed by mixing a

solution of the polysulfone polymer described herein with a solution of the elastomeric polymer.

In accordance with one aspect of the invention, the conjugates comprises a copolymer that comprises at least one block of a polysulfone polymer (A) and at least one block of an elastomeric polymer (B) in a general formula such as AB, ABA or BAB.

In one embodiment, the block copolymer have a structure of any of the following formulae:

wherein R_1 is C1 to C10 alkyl, C2, C4 and C6 hydroxyalkyl, C1 to C6 fluoroalkyl, phenyl, substituted phenyl, polyethylene glycol, and polyalkylene oxide such as ethylene oxide or propylene oxide; wherein R_2 , R_4 , R_5 , R_7 and R_8 are independently hydrogen, C1 to C6 alkyl, C2, C4 and C6 hydroxyalkyl, C1 to C6 fluoroalkyl, phenyl, substituted phenyl, carboxyl, amido, or ester groups bearing a polyethylene glycol, and polyalkylene oxide; wherein R_3 is hydrogen, alkyl, cycloalkyl, phenyl, carboxyl,

halo, amino, hydroxyl, amido, sulfido, and polyalkylene oxide; wherein R_9 and R_{10} are independently H, CH_3 , F and CF_3 ; wherein R_6 is a perfluoroalkyl group; and wherein n and m are independently positive integers. In an example, R_1 is butyl, isobutyl or isopropyl; R_2 is hydrogen or methyl; R_3 is hydrogen, halo, or methyl; R_4 and R_5 are independently hydrogen, methyl, ethyl, isopropyl, butyl, isobutyl, or phenyl; R_6 is F, CF_3 , CF_2CF_3 , $CF_2CF_2CF_3$, perfluoroisopropyl, perfluorobutyl or perfluoroisobutyl; R_7 and R_8 are independently methyl, ethyl, propyl, isopropyl, butyl, or isobutyl group; where R_9 and R_{10} are independently H, methyl, F, and CF_3 . In another example, R_1 is butyl; R_2 is methyl; R_3 is hydrogen; R_4 and R_5 are methyl groups; R_6 is CF_3 ; and R_7 and R_8 are methyl group; and R_9 and R_{10} are CH_3 groups. In a further example, the copolymer has one of the following structures:

The copolymers described herein can be formed by linking the polysulfone block and the elastomeric block by chemical reaction. Generally, block copolymers described herein can be formed by (1) attaching a functional group to either the polysulfone or elastomeric polymer or both, and (2) forming the block copolymer by

linking the polysulfone and the elastomeric polymer via the functional group. For example, where the polysulfone is a polyether sulfone block copolymer, it can be synthesized by a variety of techniques via the formation of a polymer graft, the formation of a pseudo-living free-radical polymer by ATRP (atom-transfer radical polymerization), reverse-ATRP (see, for example, Qin, et al., J. Polym Sci. Part A, 5 Polym Chem. 39:3464-3473 (2001)), thermal (see, for example, Liu, et al., J. Macromol. Sci-Pure Appl. Chem. A38(2):209-219 (2001)) or photo-initiator (see, for example, Otsu, et al., Makromolek Chem. Rapid Commun. 3:127 (1982)) using a macro-initiator, or the formation of appropriate reactive functionalities with anionic 10 polymerizations. For example, hydrophilic components such as methacrylic acid, hydroxyl ethyl methacrylate, etc. can be introduced into the copolymer by polymerizing one of the hydrophilic components with a useful monomer such as a long chain methacrylate.

Schemes I-IV illustrate some exemplary methods of making the copolymer 15 comprising at least a block of the polysulfone polymer and at least a second block of an elastomeric polymer. Scheme I shows the synthesis of a tolyl endcapped macromer of methacrylate (M_w : 10,000 to 100,000 Daltons):

As shown in Scheme I, a methacrylate can be first subjected to polymerization with an initiator, for example, an anionic initiator. The polymerization can be then terminated with a material having a desired functionality, for example, tolyl halide with a phenyl ring, forming a macromer of methacrylate endcapped with the desired functionality.

The tolyl-endcapped-methacrylate macromer can then be used to terminate the Friedels Craft condensation reaction of an aromatic compound such as phenol ether or bibenzene with the acrylate tolyl functionality (Scheme II):

Alternatively, the copolymer can be synthesized via the formation of a macromer of polysulfone followed by the formation of the block of an elastomeric polymer (Schemes III-IV). In Scheme III, the Friedels Craft condensation reaction of

an aromatic compound such as phenol ether or bibenzene is terminated with toluene, forming a toluene endcapped macromer of sulfone. The toluene is further derivatized to form a macro-initiator of a polysulfone macromer.

Scheme III

- 5 The macro-initiator of polysulfone macromer can then be used to initiate the polymerization of acrylate or methacrylate under thermal conditions, for example, heating at about 80 °C in the presence of a base such as $(\text{CH}_3)_3\text{COK}$ in a solvent such as tetrahydrofuran (THF) to generate the block copolymer, poly(ether sulfone-block-acrylate) or poly(ether sulfone-block-methacrylate) (Scheme IV).

Scheme IV

The block copolymer of polysulfone and an elastomeric polymer can be synthesized via other routes and techniques documented in the field (see, for example, Hadjichristidis, et al., Block Copolymers: Synthetic Strategies, Physical Properties, and Applications, Wiley Europe (2002)).

Bioactive Agents

The bioactive agent can be any agent which is biologically active, for example, a therapeutic, prophylactic, or diagnostic agent. Examples of suitable therapeutic and prophylactic agents include synthetic inorganic and organic compounds, proteins and peptides, polysaccharides and other sugars, lipids, and DNA and RNA nucleic acid sequences having therapeutic, prophylactic or diagnostic activities. Nucleic acid sequences include genes, antisense molecules which bind to complementary DNA to inhibit transcription, and ribozymes. Compounds with a wide range of molecular weight can be used, for example, between 100 and 500,000 grams or more per mole. Examples of suitable materials include proteins such as antibodies, receptor ligands, and enzymes, peptides such as adhesion peptides, saccharides and polysaccharides,

synthetic organic or inorganic drugs, and nucleic acids. Examples of materials which can be encapsulated include enzymes, blood clotting factors, inhibitors or clot dissolving agents such as streptokinase and tissue plasminogen activator; antigens for immunization; hormones and growth factors; polysaccharides such as heparin;

5 oligonucleotides such as antisense oligonucleotides and ribozymes and retroviral vectors for use in gene therapy. Representative diagnostic agents are agents detectable by x-ray, fluorescence, magnetic resonance imaging, radioactivity, ultrasound, computer tomography (CT) and positron emission tomography (PET). Ultrasound diagnostic agents are typically a gas such as air, oxygen or perfluorocarbons.

10 In the case of controlled release, a wide range of different bioactive agents can be incorporated into a controlled release device. These include hydrophobic, hydrophilic, and high molecular weight macromolecules such as proteins. The bioactive compound can be incorporated into the polymeric coating in a percent loading of between 0.01% and 70% by weight, more preferably between 5% and 30%
15 by weight.

In one embodiment, the bioactive agent can be for inhibiting the activity of vascular smooth muscle cells. More specifically, the bioactive agent can be aimed at inhibiting abnormal or inappropriate migration and/or proliferation of smooth muscle cells for the inhibition of restenosis. The bioactive agent can also include any
20 substance capable of exerting a therapeutic or prophylactic effect in the practice of the present invention. For example, the bioactive agent can be for enhancing wound healing in a vascular site or improving the structural and elastic properties of the

vascular site. Examples of active agents include antiproliferative substances such as actinomycin D, or derivatives and analogs thereof (manufactured by Sigma-Aldrich 1001 West Saint Paul Avenue, Milwaukee, WI 53233; or COSMEGEN available from Merck). Synonyms of actinomycin D include dactinomycin, actinomycin IV, 5 actinomycin I₁, actinomycin X₁, and actinomycin C₁. The bioactive agent can also fall under the genus of antineoplastic, anti-inflammatory, antiplatelet, anticoagulant, antifibrin, antithrombin, antimitotic, antibiotic, antiallergic and antioxidant substances. Examples of such antineoplastics and/or antimitotics include paclitaxel (e.g. TAXOL[®] by Bristol-Myers Squibb Co., Stamford, Conn.), docetaxel (e.g. Taxotere[®], from 10 Aventis S.A., Frankfurt, Germany) methotrexate, azathioprine, vincristine, vinblastine, fluorouracil, doxorubicin hydrochloride (e.g. Adriamycin[®] from Pharmacia & Upjohn, Peapack N.J.), and mitomycin (e.g. Mutamycin[®] from Bristol-Myers Squibb Co., Stamford, Conn.). Examples of such antiplatelets, anticoagulants, antifibrin, and antithrombins include sodium heparin, low molecular weight heparins, heparinoids, 15 hirudin, argatroban, forskolin, vapiprost, prostacyclin and prostacyclin analogues, dextran, D-phe-pro-arg-chloromethylketone (synthetic antithrombin), dipyridamole, glycoprotein IIb/IIIa platelet membrane receptor antagonist antibody, recombinant hirudin, and thrombin inhibitors such as Angiomax[®] (Biogen, Inc., Cambridge, Mass.). Examples of such cytostatic or antiproliferative agents include angiopeptin, 20 angiotensin converting enzyme inhibitors such as captopril (e.g. Capoten[®] and Capozide[®] from Bristol-Myers Squibb Co., Stamford, Conn.), cilazapril or lisinopril (e.g. Prinivil[®] and Prinzide[®] from Merck & Co., Inc., Whitehouse Station, NJ);

calcium channel blockers (such as nifedipine), colchicine, fibroblast growth factor (FGF) antagonists, fish oil (omega 3-fatty acid), histamine antagonists, lovastatin (an inhibitor of HMG-CoA reductase, a cholesterol lowering drug, brand name Mevacor[®] from Merck & Co., Inc., Whitehouse Station, NJ), monoclonal antibodies (such as
5 those specific for Platelet-Derived Growth Factor (PDGF) receptors), nitroprusside, phosphodiesterase inhibitors, prostaglandin inhibitors, suramin, serotonin blockers, steroids, thioprotease inhibitors, triazolopyrimidine (a PDGF antagonist), and nitric oxide. An example of an antiallergic agent is permirolast potassium. Other therapeutic substances or agents which may be appropriate include alpha-interferon,
10 genetically engineered epithelial cells, tacrolimus, dexamethasone, rapamycin, Everolimus, 40-O-(3-hydroxy)propyl-rapamycin, 40-O-[2-(2-hydroxy)ethoxy]ethyl-rapamycin, and 40-O-tetrazole-rapamycin. The foregoing substances are listed by way of example and are not meant to be limiting. Other active agents which are currently available or that may be developed in the future are equally applicable.

15 The dosage or concentration of the bioactive agent required to produce a favorable therapeutic effect should be less than the level at which the bioactive agent produces toxic effects and greater than the level at which non-therapeutic results are obtained. The dosage or concentration of the bioactive agent required to inhibit the desired cellular activity of the vascular region can depend upon factors such as the
20 particular circumstances of the patient; the nature of the trauma; the nature of the therapy desired; the time over which the ingredient administered resides at the vascular site; and if other active agents are employed, the nature and type of the

substance or combination of substances. Therapeutic effective dosages can be determined empirically, for example by infusing vessels from suitable animal model systems and using immunohistochemical, to determine the biological effect of a particular dose curve as established by pharmacokinetic and pharmacodynamic studies.

- 5 Standard pharmacological test procedures to determine dosages are understood by one of ordinary skill in the art.

Methods of Using the Polysulfone Composition

The polysulfone composition can be coated onto any implantable device by any established coating process, e.g., a spray process. Generally, the coating process
10 involves dissolving or suspending the composition in a solvent to form a solution or a suspension of the coating composition, and then applying the solution or suspension to an implantable device such as a DES.

As used herein, an implantable device may be any suitable medical substrate that can be implanted in a human or veterinary patient. A preferred implantable
15 device is DES. Examples of stents include self-expandable stents, balloon-expandable stents, and stent-grafts. Other exemplary implantable devices include grafts (e.g., aortic grafts), artificial heart valves, cerebrospinal fluid shunts, pacemaker electrodes, and endocardial leads (e.g., FINELINE and ENDOTAK, available from Guidant Corporation, Santa Clara, CA). The underlying structure of the device can be of
20 virtually any design. The device can be made of a metallic material or an alloy such as, but not limited to, cobalt chromium alloy (ELGILOY), stainless steel (316L), high nitrogen stainless steel, e.g., BIODUR 108, cobalt chrome alloy L-605, "MP35N,"

“MP20N,” ELASTINITE (Nitinol), tantalum, nickel-titanium alloy, platinum-iridium alloy, gold, magnesium, or combinations thereof. “MP35N” and “MP20N” are trade names for alloys of cobalt, nickel, chromium and molybdenum available from Standard Press Steel Co., Jenkintown, PA. “MP35N” consists of 35% cobalt, 35% nickel, 20% chromium, and 10% molybdenum. “MP20N” consists of 50% cobalt, 20% nickel, 20% chromium, and 10% molybdenum. Devices made from bioabsorbable or biostable polymers could also be used with the embodiments of the present invention.

While particular embodiments of the present invention have been shown and described, it will be obvious to those skilled in the art that changes and modifications can be made without departing from this invention in its broader aspects. Therefore, the appended claims are to encompass within their scope all such changes and modifications as fall within the true spirit and scope of this invention.
